

CLAUDE.md — NetO Coaching Income Tracker

What This Project Is

NetO is a PWA (Progressive Web App) coaching income tracker built for Nero — a tennis and padel coach operating across the US, Argentina, and The Bahamas. It tracks session income, tips, and match fees. It auto-calculates earnings from a user-defined rate card. It supports multiple coaches (multi-user) via username + PIN authentication.

The current deployed version is **NetO v3**, hosted on Netlify as a static site.

Stack

- **Language:** Vanilla HTML, CSS, JavaScript — no framework, no build tools
 - **Dependencies:** Google Fonts via CDN only
 - **Architecture:** Single-file app (`index.html`)
 - **Storage:** `localStorage` — all data lives on the user's device, per browser
 - **Backend:** None. No server. No database. No API calls.
 - **Deployment:** Netlify static hosting
-

What This App Does

- Multi-user login: username + PIN authentication stored in `localStorage`
- Session logging: type (tennis/padel/match), duration, tip, auto-calculated income
- Rate card: user-defined rates per session type
- Weekly/monthly/summer goal tracking
- Coach report: best day, slowest day, \$/hr efficiency by session type
- Week counter anchored to account creation date
- PWA: installable on iOS and Android via "Add to Home Screen"

Architecture Rules

- **One file only.** All HTML, CSS, and JS lives in `index.html` . Do not split into separate files unless explicitly instructed.
- **No frameworks.** Do not introduce React, Vue, Alpine, or any JS framework. Ever.
- **No build tools.** No Webpack, Vite, npm, or package.json. This is a static file.
- **No backend.** Do not suggest APIs, servers, databases, or cloud storage. `localStorage` is the intentional choice.
- **No new CDN dependencies** without explicit approval. Google Fonts is the only external dependency.

localStorage Schema

All data is namespaced by username to support multi-user. Do not flatten or restructure keys without a migration plan.

Key patterns:

- `neto_users` — array of registered user objects
- `neto_sessions_{username}` — array of session log entries per user
- `neto_settings_{username}` — rate card and preferences per user
- `neto_goals_{username}` — weekly/monthly/summer goal targets per user

Rules:

- Never rename or restructure existing keys without writing a migration function
- Never clear `localStorage` without explicit user action
- Always check if a key exists before reading; default gracefully if null

Current State

- Deployed and tested on Edge desktop
- `localStorage` confirmed working

- Week counter anchored to account creation date
 - **No GitHub repo yet** — code lives in Claude conversation history
 - Latest version: NetO v3
-

Next Steps Planned

1. Language toggle (English / Spanish)
 2. Week 1 historical data migration for original user
 3. Eventual App Store submission (PWA wrapper)
-

Do Not Do

- Do not add a backend or suggest migrating to one unless explicitly asked
 - Do not split the single file into multiple files
 - Do not rename localStorage keys without a migration function
 - Do not introduce any JS framework or build toolchain
 - Do not add CDN dependencies without approval
 - Do not rewrite sections of the app that aren't part of the current feature
 - Do not assume the rate card structure — always read the existing schema first
-

Before Every Feature

1. Read the full current `index.html` before writing a single line
 2. Map which functions and localStorage keys the feature will touch
 3. Identify what currently works that could break
 4. Flag any risk (data migration, multi-user edge cases, PWA manifest impact)
 5. Get approval on the plan before writing code
-

When Something Breaks

- Do not patch over it by adding more code
 - Identify the root cause first
 - If the wrong assumption is deep in the conversation context, start a fresh session with the correct assumption in the first prompt
 - A clean session beats a patched session every time
-

Language Toggle (Upcoming)

- All user-facing strings must eventually support EN and ES
 - When adding new UI text, add it to the strings object — do not hardcode text directly into HTML
 - Do not start the language toggle implementation until explicitly asked
-

PWA Rules

- Do not modify the service worker or manifest without understanding caching implications
- Manifest changes require a retest of “Add to Home Screen” on both iOS and Android
- Cache versioning must be bumped when assets change
